

What is Claimed is:

1        1. A method for conversion of signals, comprising:  
2            receiving a first plurality of bits from a first signal;  
3            performing a look-up in a table with a first subset of bits in the first plurality of  
4 bits to generate a result;  
5            adding the result to a sum;  
6            performing another look-up in the table with the next subset of bits in the first  
7 plurality of bits and adding the result to the sum until a look-up with a last subset of bits in the  
8 first plurality of bits is performed and the result added to sum;  
9            providing the sum as a first multiple bit value of a second signal; and  
10           receiving a second plurality of bits from the first signal and converting to a second  
11 multiple bit value of the second signal using the steps described above until all bits in the first  
12 signal have been converted.

1        2. The method of Claim 1, wherein the first signal is a direct stream digital (DSD)  
2 signal.

1        3. The method of Claim 1, wherein the second signal is a pulse code modulated  
2 (PCM) signal.

1        4. The method of Claim 1, wherein each plurality of bits has the same number of bits  
2 and each subset of bits in the plurality of bits has the same number of bits.

1        5. The method of Claim 4, wherein the table is a two dimensional array containing a  
2 plurality of elements, the size of the first dimension equal the number of bits in the plurality of  
3 bits divided by the number of bits in the subset of the plurality of bits, the size of the second  
4 dimension equal to  $2^{(\text{number of bits in subset})}$ .

1        6.     The method of Claim 5, wherein each element contains one multiple bit result,  
2     wherein performing the look-up in the table comprises accessing the element in the array that  
3     corresponds to the number of the subset in the plurality of bits and the value of the subset of bits.

1        7.     A method for conversion of direct stream digital (DSD) signals to pulse code  
2     modulated (PCM) signals, comprising:

3              receiving a first plurality of bits from the DSD signal;

4              performing a look-up in a table with a first word in the first plurality of bits to  
5     generate a result;

6              adding the result to a sum;

7              performing another look-up in the table with the next word in the first plurality of  
8     bits and adding the result to the sum until a look-up with a last word in the first plurality of bits is  
9     performed and the result added to sum;

10             providing the sum as a first multiple bit value of a PCM signal; and

11             receiving a second plurality of bits from the DSD signal and converting to a  
12     second multiple bit value of the PCM signal using the steps described above until all bits in the  
13     DSD signal have been converted.

1        8.     The method of Claim 7, wherein each plurality of bits has the same number of bits  
2     and each word in the plurality of bits has the same number of bits.

1        9.     The method of Claim 8, wherein the table is a two dimensional array containing a  
2     plurality of elements, the size of the first dimension equal the number of bits in the plurality of  
3     bits divided by the number of bits in the word, the size of the second dimension equal to  $2^{(\text{number of bits in word})}$ .

1        10.    The method of Claim 9, wherein each element contains one multiple bit result,  
2     wherein performing the look-up in the table comprises accessing the element in the array that  
3     corresponds to the number of the word in the plurality of bits and the value of the word.

1        11. An apparatus for conversion of signals, comprising:  
2              a first-in-first-out (FIFO) buffer that contains a plurality of bits from a first signal,  
3        wherein the plurality of bits is further divided into a plurality of subset of bits of the same size;  
4              a look-up table coupled to the FIFO buffer, wherein the look-up table generates a  
5        result for each of the plurality of subset of bits; and  
6              an accumulator coupled to the look-up table, the accumulator holding the results  
7        added together, wherein after adding the result for the last subset of bits in the plurality of bits,  
8        the accumulator generates at an output a multiple bit second signal.

1        12. The apparatus of Claim 11, further comprising an address generator connected to  
2        the FIFO buffer and look-up table, said address generator providing to the look-up table the  
3        address of a section in the look-up table corresponding to each of the plurality of subset of bits,  
4        each of said sections including a plurality of results for each subset of bits, wherein the value of  
5        the subset of bits selects one of the plurality of results.

1        13. The apparatus of Claim 12, wherein the address of each section in the look-up  
2        table corresponding to each of the plurality of subset of bits is sequential.

1        14. The apparatus of Claim 11, wherein the first signal is a direct stream digital  
2        (DSD) signal.

1        15. The apparatus of Claim 11, wherein the second signal is a pulse code modulated  
2        (PCM) signal.

1        16. The apparatus of Claim 11, wherein the look-up table is contained in a memory  
2        located on a digital signal processor (DSP).

1        17. The apparatus of Claim 11, wherein the look-up table is contained in an external  
2        memory coupled to a digital signal processor (DSP).

1        18. An apparatus for conversion of direct stream digital (DSD) signals to pulse code  
2 modulated (PCM) signals, comprising:

3              a first-in-first-out (FIFO) buffer that contains a plurality of bits from the DSD  
4 signal, wherein the plurality of bits is further divided into a plurality of words of the same size;

5              a look-up table coupled to the FIFO buffer, wherein the look-up table generates a  
6 result for each word; and

7              an accumulator coupled to the look-up table, the accumulator holding the results  
8 added together, wherein after adding the result for the last word in the plurality of bits, the  
9 accumulator generates at an output a multiple bit PCM signal.

1        19. The apparatus of Claim 18, further comprising an address generator connected to  
2 the FIFO buffer and look-up table, said address generator providing to the look-up table the  
3 address of a section in the look-up table corresponding to each of the plurality of words, each of  
4 said sections including a plurality of results for each word, wherein the value of the word selects  
5 one of the plurality of results.

1        20. The apparatus of Claim 18, wherein the look-up table is contained in a memory  
2 located on a digital signal processor (DSP).

1        21. The apparatus of Claim 18, wherein the look-up table is contained in an external  
2 memory coupled to a digital signal processor (DSP).

1        22. An apparatus for conversion of signals, comprising:

2              means for receiving a first plurality of bits from a first signal;

3              means for performing a look-up in a table with a first subset of bits in the first  
4 plurality of bits to generate a result;

5              means for adding the result to a sum;

6              means for performing another look-up in the table with the next subset of bits in  
7 the first plurality of bits and adding the result to the sum until a look-up with a last subset of bits  
8 in the first plurality of bits is performed and the result added to sum;

9           means for providing the sum as a first multiple bit value of a second signal; and  
10          means for receiving a second plurality of bits from the first signal and converting  
11         to a second multiple bit value of the second signal using the steps described above until all bits in  
12         the first signal have been converted.
